

Capsule Context CLI: The Ultimate Playbook

Your Seamless Multi-AI Collaboration Guide

1. What is Capsule Context?

Imagine you're working with an AI assistant, and you reach your daily limit. You switch to a different AI, but it has no idea what you just did. **Capsule Context** solves this. It acts as a shared memory bank stored directly in your project folder.

2. Initial Setup (Do this once)

Before using the tool for the first time on your PC:

1. **Open PowerShell or Terminal.**
2. **Run these commands:**

```
cd C:\Users\sande\capsule-context-cli  
npm link
```

This registers the `capsule-context` command so you can use it anywhere.

3. The Daily Workflow

Follow these simple steps every time you work on a project.

Step 1: Initialize Your Project

When starting a new project (or adding Capsule to an existing one), run this inside your project folder:

```
capsule-context init
```

Step 2: Start the Silent Watcher

Open a dedicated terminal window and run:

```
capsule-context watch
```

Why? This tracks every file change automatically. Leave this window open while you work.

Step 3: Record Your Progress

When you're ready to take a break or switch AIs, run:

```
capsule-context capture "Finished the user login logic"
```

Step 4: The Handoff (Syncing to a new AI)

When you open a new AI CLI, tell Capsule which one you are using:

```
capsule-context continue gemini # For Gemini CLI
capsule-context continue claude # For Claude Code
capsule-context continue codex # For Codex/AGENTS
```

4. Cheat Sheet of Commands

Command	Action
<code>init</code>	Creates the memory folder (<code>.capsule</code>)
<code>watch</code>	Automatically tracks file changes
<code>capture "msg"</code>	Manually saves your progress
<code>continue <target></code>	Prepares the next AI with your context
<code>status</code>	Shows your current project "memory" status

5. Essential Rules

1. **Run inside the folder:** Always run `capsule-context` commands from your project's main directory.
2. **Be descriptive:** In your `capture` message, explain *why* you did something.
3. **Sync early:** Always run the `continue` command as the first step when opening a new AI.
